

DISTILLATION CAPABILITIES

Using fractional vacuum distillation in our Bremen, Indiana facility, we're able to reduce or remove undesirable components and odors to increase an oil's usability. Our five distillation units are efficient at whatever your desired quantity, from smaller batches to rectifying at a rate of 180 kg per hour. With these distillation capabilities, we're able to create unique products like Tea Tree Oil Heart. These products provide customers with the oil's qualities they desire but not the ones they don't. Through innovation in distillation, we're able to offset supply and quality issues, resulting in consistency and lower costs for materials.

We have 5 distillation units, but our largest production unit is an all stainless steel, two column, continuous still. The feed rate is up to 500 lbs/hr for dry vacuum distillation.
